

DEMO · 4 MINUTES

From Social Noise to Verified Signal

A shared, honestly-graded common operating picture for emergency operations centres.

We find where impacts may be emerging from public information.

GeoNet

Mastodon

What We Do

From raw social feeds to a decision an EOC can act on.

01

Consume

Pull continuous data from social media platforms and public data feeds.

02

Validate

Filter and grade what comes in, so the noise is removed and only signal remains.

03

Guide

To enable WCC make decisions.

The goal: **help the EOC decide where and when an emergency assistance centre is needed.**

Turning Social Noise into Signal

Every post goes through the same five-stage pipeline before it can reach the map.

Ingest

Consume information from social media feed in real-time

Enrichment

Corroborate

Cluster independent posts that describe the same thing in the same place.

Grade

Score every cluster A–F for source, 1–6 for credibility — never higher than a human confirms.

Signal

An Api is available to pull the data into other systems as required

The consumption of social media to make informed decision in an emergency to save lives.

The Live Map

Real signals, right now — across seven official and community sources.

Data sources

- Reddit
- Mastodon
- Facebook (via screen capture)
- News Sources and Forums via RSS
- Claude Skill to make new ones

Admiralty grading — on everything

A–F source reliability × **1–6** information credibility

Two independent axes — Wellington's EOC already grades this way — so a rumour from an unknown account and a confirmed Police report never collapse into one number.

“Credibility 1 — confirmed — is never assigned by this software.”

Colour means corroboration — nothing else

A cluster warms as independent sources describe the same thing in the same place. Click it — every inference carries its evidence: location confidence, and the terms that triggered the issue type.

The Human Loop

Verification is a person's job. The software only shows the flag.

"Twenty people have posted about this street in Newtown — can somebody go and verify that?"

1

Signal flagged

Intelligence sees a cluster forming from multiple posts.

2

Ops sends someone

Logistics asks operations to physically check the street.

3

Marked field-verified

One click — the only route to credibility grade 1.

4

Rationale recorded

"Field-verified by council officer" — not "the algorithm decided."

One Shared Picture

Live, open endpoints

signals.geojson and clusters.geojson — not a walled garden.

Composable by design

Any other team's module can consume the same feed.

Already deployed

Running on Azure, with MongoDB Atlas behind it.

We don't tell you what's true.

We tell you what's worth looking at — and exactly how much to trust it.
